1. Executive Overview

PulseFutures Bot is a Telegram-based crypto futures workflow assistant designed to help you scan markets faster, spot structured setups, size positions consistently, and keep your execution process disciplined. The live user experience in the current codebase revolves around market scanning, setup visibility, risk settings, trade journaling, plan-aware delivery, and optional email alerts for supported plans.

Important: PulseFutures is a decision-support system. It helps you filter, size, track, and review trades, but you remain responsible for every order you place.

Who it is for: traders who want fewer, more structured opportunities instead of constant noise, and who value a repeatable process over emotional chart-chasing.

2. What PulseFutures Does for You

- Scans the market through /screen and presents qualified trade ideas in a fast Telegram workflow.
- Lets you define your equity, per-trade risk, and total daily risk cap before using the sizing tool.
- Supports session control so you can focus on ASIA, LON, NY, or a broader schedule depending on your routine.
- Includes an internal trade journal so you can record opens, stop-loss updates, risk-free transitions, and final closes.
- Provides plan-aware delivery: Telegram-first for all active users and email alerts/features for eligible users.
- Offers performance reporting, billing access, support ticketing, and plan visibility from inside the bot.

In practical terms, PulseFutures helps reduce decision fatigue. Instead of scanning dozens of charts manually, you can use the bot as your structured front door: scan, review, size, execute, log, then review performance.

3. How the Bot Works

3.1 From scan to setup

1. Use /screen to scan the market for current opportunities.
2. Review the setup details shown by the bot, including symbol, direction, entry area, stop loss, and target structure where provided.
3. Use /size before placing a trade so your quantity matches your chosen risk settings.
4. Place your trade on your exchange only if the setup still makes sense to you.
5. Log the trade with /trade_open so your journal, risk tracking, and reports remain accurate.
6. Update the position as it evolves with /trade_sl, /trade_rf, and /trade_close.

3.2 What you will see in Telegram

The user-facing output focuses on actionable information: setup direction, entry, stop-loss logic, target structure, timing context, and command-driven follow-up tools such as sizing and journaling. The bot is designed to reject many weak conditions rather than flood you with constant signals.

3.3 Time-sensitive setups

The current codebase includes a time-sensitive entry concept for generated setups. As a user, treat fresh signals as intended for prompt review rather than delayed chasing. If price has already moved materially away from the original idea, re-evaluate before acting.

Best practice: A good operating habit is: scan -> review -> size -> execute or skip. Avoid entering old setups late just because they still look interesting.

4. Plans and Access

4.1 Trial

New users receive a 7-day trial automatically on first use. During the active trial window, the code treats the user as having full Pro-level access.

4.2 Standard

Standard is the Telegram-first subscription tier. It is suitable for users who want the core bot workflow inside Telegram without relying on email delivery.

4.3 Pro

Pro adds email-based convenience and the wider alert/reporting workflow exposed to eligible users in the live bot.

Plan	Best for	What you get
Trial (7 days)	First-time users	Pro-level access during the trial period
Standard	Telegram-only users	Core scan, sizing, journaling, reports, billing and support workflow
Pro	Users who want alerts by email as well	Telegram workflow plus email settings, email tests, and alert controls

5. Quick Start

5.1 First-time setup

1. Run /start to initialize your profile and activate your trial if you are new.
2. Run /status or /myplan to confirm your current plan.
3. Set your timezone with /tz Australia/Melbourne or your own IANA timezone.
4. Set your equity with /equity 1000 (example only - use your real reference amount).
5. Define your per-trade risk using /riskmode pct 1.5 or /riskmode usd 25.
6. Define your total daily risk cap using /dailycap pct 5 or /dailycap usd 60.
7. Choose your sessions with /sessions, /sessions_on NY, or /sessions_off ASIA.
8. If your plan supports email, save your address using /email you@example.com and confirm it with /email_test.

5.2 Your first signal workflow

1. Run /screen.
2. Pick a setup you want to evaluate.
3. Calculate size: /size BTC long entry 43000 sl 42000
4. Open the trade journal entry after you place the trade: /trade_open BTC long entry 43000 sl 42000 [note first test]
5. If you move the stop later: /trade_sl 1 42500
6. If the trade becomes risk-free: /trade_rf 1
7. When you exit: /trade_close 1 pnl +85.5

6. Command Reference

6.1 Core commands

Command	Purpose	Who	Example	What you see	Notes
/help	Quick overview of the product	All active users	/help	Short product overview and key paths	Best first command after joining
/commands	Command guide inside Telegram	All active users	/commands	Grouped command list with examples	Useful quick reference
/guide_full	Download the full user guide	All active users	/guide_full	Guide file sent by the bot	Good for offline reading
/status	View your live user status	All active users	/status	Plan, equity, risk, sessions, email settings, caps and more	Use this often
/myplan	Check your plan status	All active users	/myplan	Plan, access state, expiry if applicable	Useful before upgrading
/screen	Scan the market for setups	Active users	/screen	Current setup candidates from the scan engine	Core discovery command

6.2 Risk and sizing

Command	Purpose	Who	Example	What you see	Notes
/equity	View or set your equity reference	Users	/equity 1000	Stored equity amount	Used by /size when risk mode is percentage-based
/equity_reset	Reset stored equity to zero	Users	/equity_reset	Equity reset confirmation	Re-enter equity before sizing again
/riskmode	Set per-trade risk	Users	/riskmode pct 1.5	Current or updated per-trade risk	Supports pct or usd
/dailycap	Set total daily risk cap	Users	/dailycap usd 60	Current or updated daily cap	Separate from per-trade risk
/size	Calculate position size	Active users	/size BTC long entry 43000 sl 42000 risk usd 40	Entry, stop, risk and quantity	Entry and stop are required
/limits	Set selected risk/email limits	Users	/limits maxtrades 5	Current values or update confirmation	Also supports emailcap, emailgap, emaildaycap

6.3 Trade journal

Command	Purpose	Who	Example	What you see	Notes
/trade_open	Log an opened trade	Active users	/trade_open BTC long entry 43000 sl 42000 [note breakout]	Trade ID, risk, qty, daily risk update	Risk can be inherited from /riskmode
/trade_sl	Update stop loss	Active users	/trade_sl 1 42500	Updated stop and recalculated risk	Can release or increase daily risk
/trade_rf	Mark a trade risk-free	Active users	/trade_rf 1	Released risk confirmation	Useful after moving stop to entry or beyond
/trade_close	Close a journaled trade	Active users	/trade_close 1 pnl +85.5	PnL, R-multiple, new equity	Use signed PnL value
/trade_id_reset	Reset your public trade numbering	Active users	/trade_id_reset	Counter reset confirmation	Next trade starts at ID 1

6.4 Sessions and time controls

Command	Purpose	Who	Example	What you see	Notes
/sessions	View enabled sessions	Users	/sessions	Your timezone, current session and enabled sessions	Available sessions: ASIA, LON, NY
/sessions_on	Enable a session	Users	/sessions_on NY	Updated session list	Accepts ASIA, LON or NY
/sessions_off	Disable a session	Users	/sessions_off ASIA	Updated session list	The bot keeps at least one sensible default session
/sessions_on_unlimited	Allow 24-hour session coverage	Users	/sessions_on_unlimited	Unlimited mode enabled	Useful for broader email coverage
/sessions_off_unlimited	Return to normal session logic	Users	/sessions_off_unlimited	Unlimited mode disabled	Back to enabled sessions only
/trade_window	Restrict email signal times	Users	/trade_window 09:00 17:30	Current or updated local trade window	Use /trade_window off to disable
/tz	Show or set your timezone	Users	/tz Australia/Melbourne	Current or updated timezone	Use IANA Region/City format

6.5 Email and alerts

Command	Purpose	Who	Example	What you see	Notes
/email	View, save, enable or disable email alerts	Eligible users	/email you@example.com	Stored email and on/off state	You can also use /email on or /email off
/email_test	Send a test email	Eligible users	/email_test	Delivery success or failure message	Use after setting your email
/bigmove_alert	Manage big-move alert emails	Eligible users	/bigmove_alert on 20 10	Current or updated big-move alert settings	Format is on|off [4H%] [1H%]

6.6 Reports, billing and support

Command	Purpose	Who	Example	What you see	Notes
/report_daily	View daily performance report	Eligible users	/report_daily	Daily trading summary	Use with your journal kept up to date
/report_weekly	View weekly performance report	Eligible users	/report_weekly	Weekly trading summary	Good for review sessions
/report_overall	View all-time performance report	Eligible users	/report_overall	Lifetime performance summary	Useful for long-term tracking
/billing	Open upgrade and payment instructions	All users	/billing	Stripe/USDT payment options and your reference	Use before subscribing
/support	Open a support ticket	All users	/support I need help with email setup	Ticket ID confirmation	Use /support_status to check latest ticket
/support_status	Check your latest support ticket	All users	/support_status	Latest ticket ID and status	Great after contacting support
/health	Check user-level bot health	All users	/health	Timezone, email engine state, last SMTP error if any	Helpful for email troubleshooting

7. Reading a Setup Correctly

When a setup appears, read it in this order:

1. Direction first - long/buy versus short/sell.
2. Entry level - where the idea is expected to trigger or become attractive.
3. Stop loss - the invalidation point. Never ignore it.
4. Targets - the planned upside or downside objectives.
5. Risk fit - confirm the trade still fits your per-trade and daily risk rules by using /size.
6. Timing - check whether price is still near the original setup concept or has already moved too far.

Example: Example reading flow: A BTC long setup appears. You run /size BTC long entry 43000 sl 42000. If the quantity and the daily cap both make sense, you can execute and then log the trade with /trade_open.

A setup is not an order. It is a structured trade idea. The final decision remains yours.

8. Risk and Safety Guidance

- Always configure /equity, /riskmode, and /dailycap before relying on the sizing workflow.
- Use /size before every manual trade instead of guessing quantity.
- Keep your sessions limited to the hours you actually trade well.
- Use /trade_rf and /trade_sl responsibly so your remaining daily risk stays accurate.
- Do not treat alerts as guarantees. Fast-moving markets can invalidate a trade quickly.
- Avoid revenge trading after losses. Use the journal and reports to review process, not just outcome.

Risk warning: Crypto futures involve leverage and can produce rapid losses. Even a strong setup can fail. Risk control matters more than any single signal.

9. Frequently Asked Questions

Question	Answer
Why are signals sometimes rare?	Because the system is designed to filter aggressively rather than send constant low-quality noise.
Do I need to watch Telegram all day?	No. Telegram is the main interface, and supported plans can also use email for convenience.
Does the bot place trades for me as a normal user?	The user-facing product is documented as a signal, sizing, and workflow assistant. You remain the one placing your own trades.
Can I use the bot without email?	Yes. Telegram use is central. Email is an added layer for supported access levels.
What should I do after my trial ends?	Use /billing to see upgrade instructions and then confirm your active plan through /myplan or /status.

10. Troubleshooting

Situation	What to do
I cannot receive email alerts	Run /email to confirm your saved address, then /email_test. If it fails, run /health and contact support with /support.
The bot says my trial is over	Use /billing to review payment options, then confirm your status with /myplan after activation.
My /size result says risk is zero	Set your equity first with /equity if you use percentage-based risk.
Sessions look wrong	Check your timezone with /tz and then review /sessions.
My support request is still pending	Run /support_status to see the latest ticket state.

11. Disclaimer

PulseFutures Bot provides market scanning, structured signal presentation, position-sizing support, journaling support, and workflow assistance only. It does not provide personal financial advice, portfolio advice, tax advice, legal advice, or guaranteed outcomes. Trading crypto futures involves substantial risk, including the risk of rapid loss. You are solely responsible for your own trade selection, execution, capital management, leverage decisions, and compliance obligations.
